1 Architecture

2 Functionalities

Functionalities currently implemented are:

- **Registration:** A user can create an account. All the settings defined in the assignment are included.

- **Login:** A user can use the account he created to log in. When a user logs in, a **session** will be created keeping the user logged in until he logs out or a timeout happens.

- **Statistics:** When a user logs in, this gets saved into the database. On the statistics page a user can request the statistics about his login attempts.

- **Settings:** A logged in user can access his settings and update them. (Currently all the settings except for the email)

3 Implementation choices
